

## Release Notes: Browser Support

Several browsers have discontinued the support of plugins. While the rest of our IP enabled Luma products still require Internet Explorer, the Luma 510 NVR has a firmware update with further browser support.

Update your Luma 510 NVR to firmware v3.4.95 build 191127, to view your system remotely in Chrome, Safari, and Microsoft Edge.

### Chrome, Firefox, and Microsoft Edge

To access your recorder remotely from a browser, port forward port 7681 on your router.

**Note: You cannot perform port translation. Both the internal and external port must be 7681.**

You do not need to append this port at the end of your URL as it does **not** replace your HTTP port.

**Example:** If your HTTP port is 8042, your web address stays the same: e.g., MyHome.WirepathDNS.com:8042

### Internet Explorer

Some devices require Internet Explorer to be run using compatibility view. When accessing the Luma web interface while using compatibility view, some icons are misaligned.

We recommend that the Internet Explorer compatibility view mode not be used when accessing the Luma web interface.

### Safari

If you are using Safari version 11 or earlier, click [here for the Safari plugin](#). With Safari version 12 and later, plugins are no longer supported. In that case, forward port 7681 on your router, or click here to [download the Luma VMS for Mac](#).
